

**"TO KIMBERLEY  
IF EVERYONE WAS A TOADBUSTER  
TOAD BUSTERS",  
THE TOADS WOULD BE BUSTED"**

# CANE TOAD AWARE

## HOW TO IDENTIFY A CANE TOAD

Cane toads have a distinct round, slightly swollen toxic (pin pricked) gland behind the eardrum

!

Cane toads have a distinct bony ridge over the eyes that meets the nose and a distinct ear drum between their eyes and their poison gland

!

Cane toads' skin is rough and warty. It is usually dry and leathery compared to the moist, slippery skin of native frogs

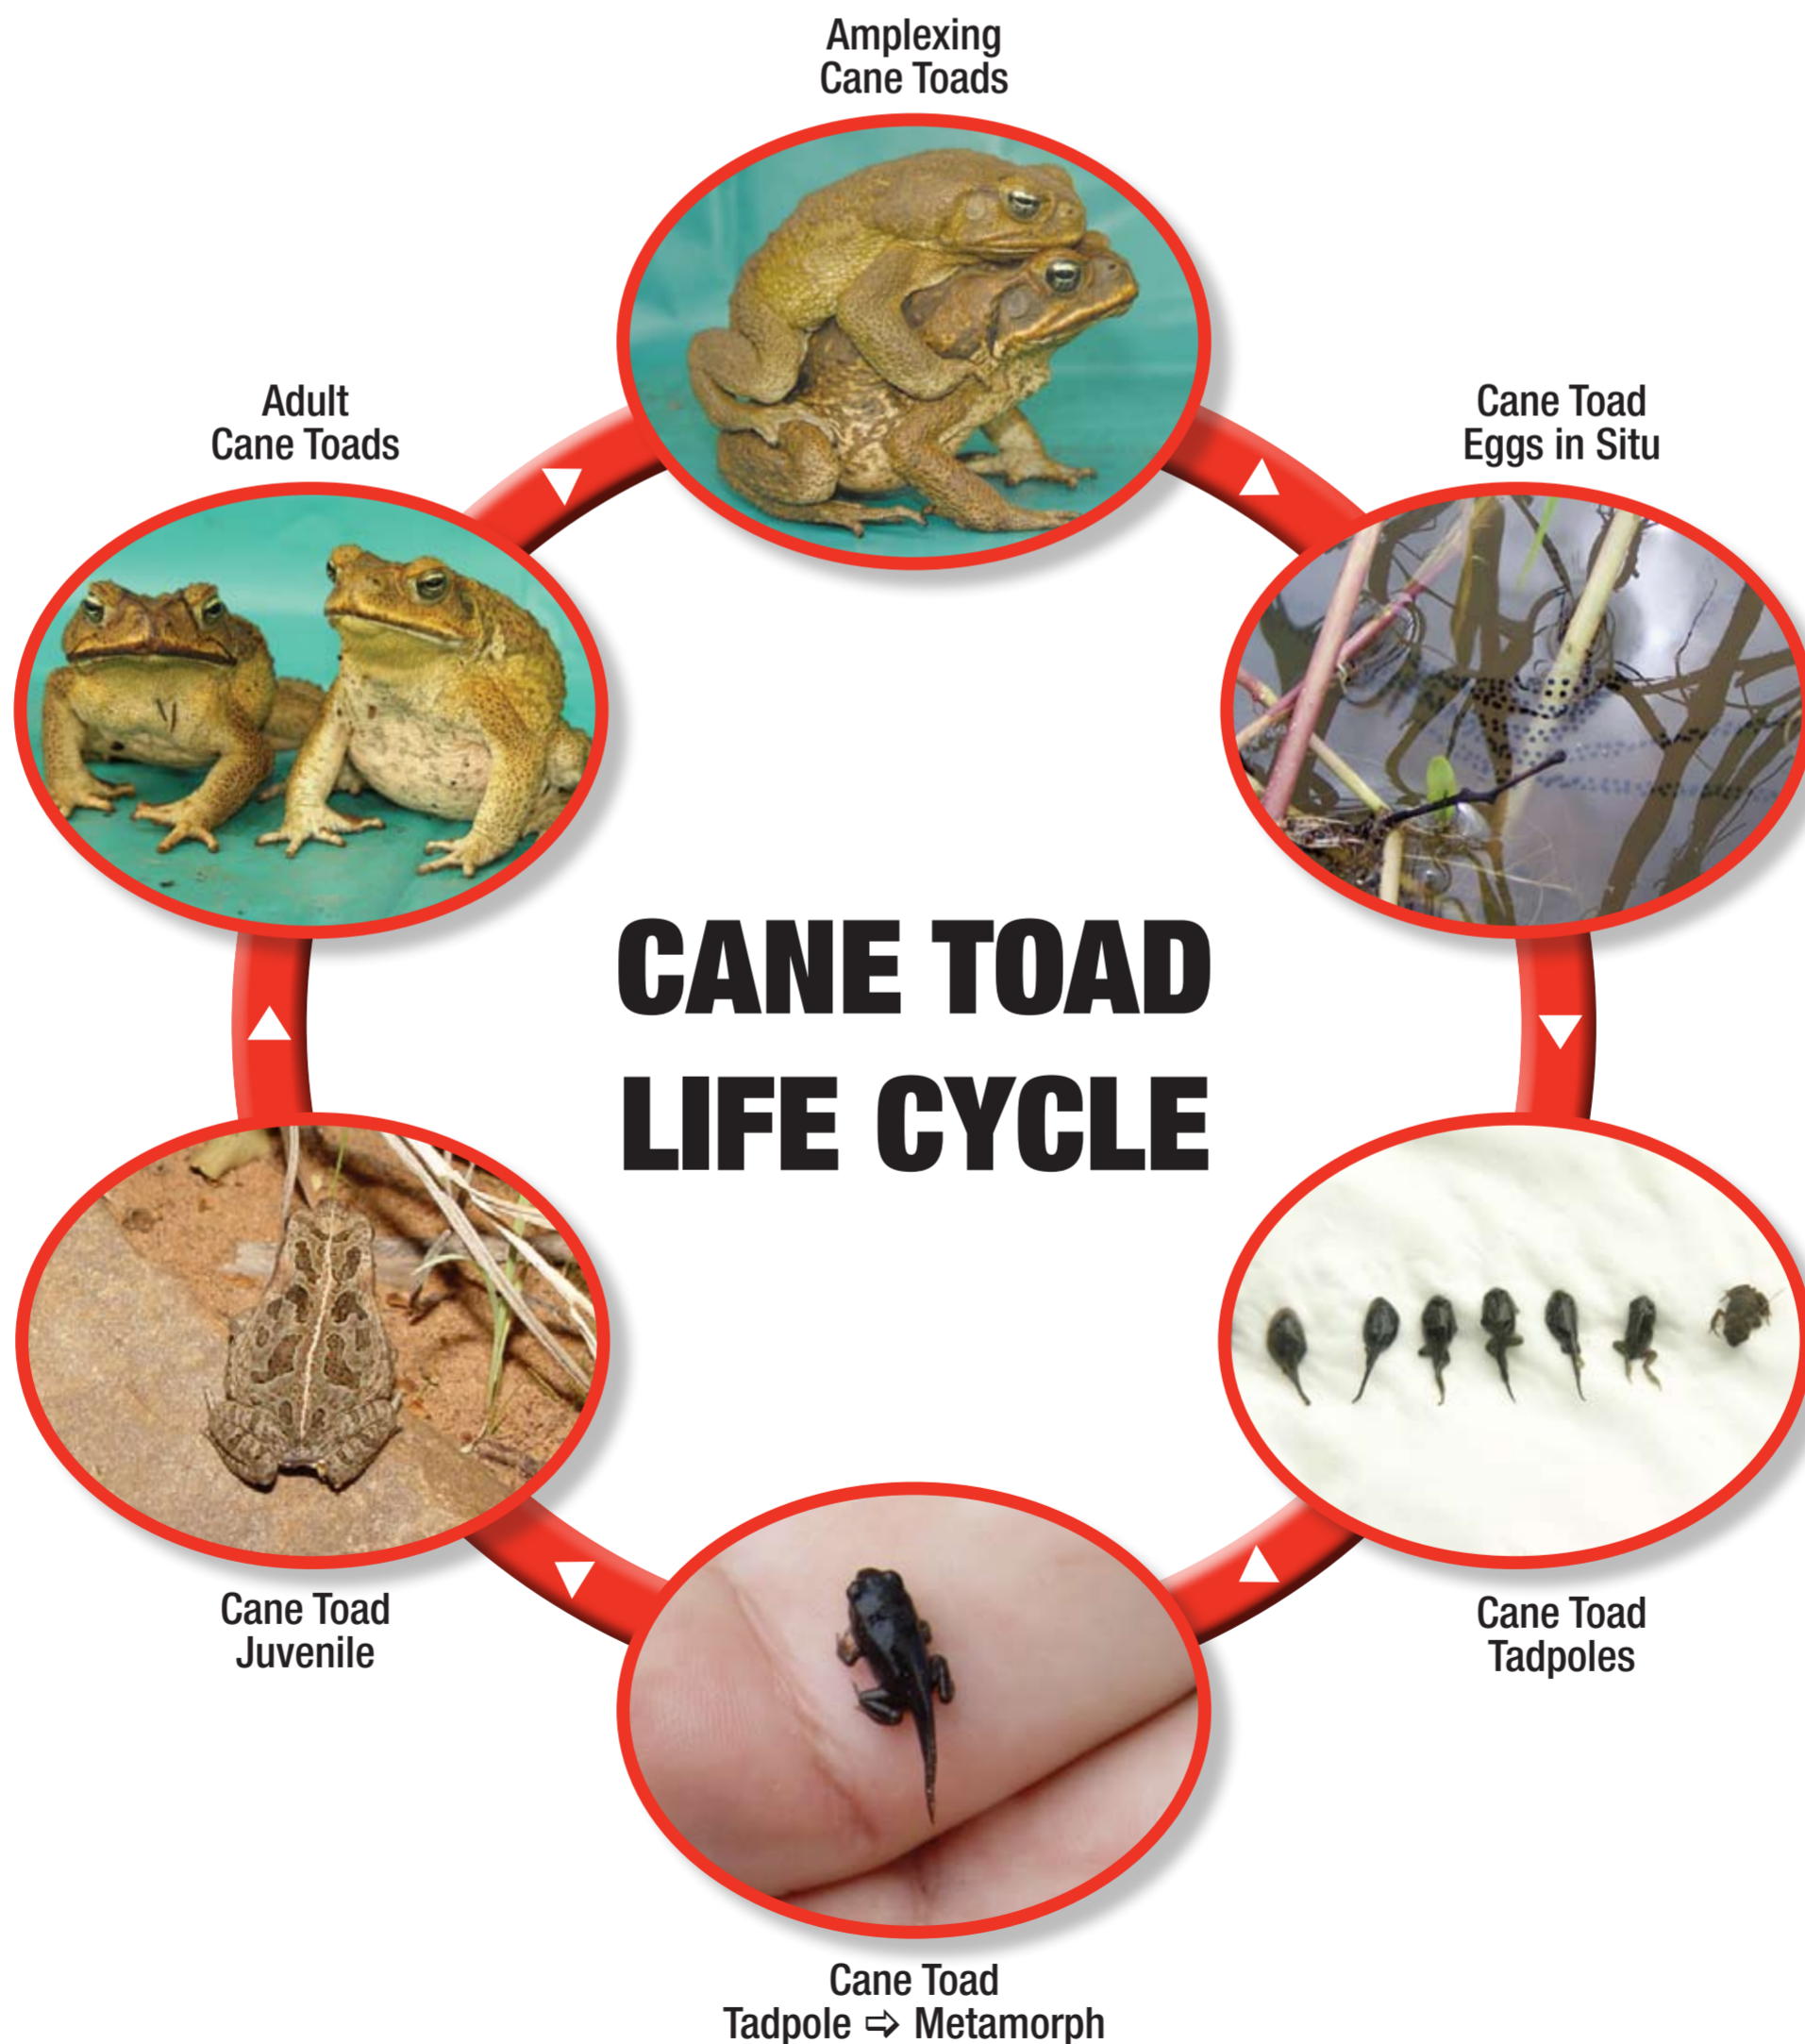

!

Males have a yellow tinge and have raised prominent bumps along their spine. The female is dull brown and the spine is smoother

!

Cane toads do not have suckers on their fingers or toes

## DON'T CONFUSE OUR NATIVE FROGS WITH CANE TOADS

Striped Rocket Frog (*Litoria nasuta*)

*Limnodynastes depressus*

Green Tree Frog (*Litoria caerulea*)

*Uperoleia* species

Bumpy Rocket Frog (*Litoria inermis*)

Burrowing Frog (*Cyclorana australis*)
